

AutoDrive Project Weekly Report - April 5th

1. Fails of the week

- The SDK of the Movidius compute stick was successfully installed, but it is a corrupted build. Probably because the build script fail to detect the versions of all its dependencies.

2. Successes of the week

- Completed most of the usability tests - in the process of wrapping up the last couple. Preliminary results look sensible and testing procedure worked out well.
- Have record several clips of the prototype running on the different tracks
- Began drafting poster for the final presentation

3. Difficulties this week

- Finding and scheduling participants was slightly difficult, but we were able to get everything done as required.
- Finding location to lay out test track and film video for final presentation is difficult. We need a large indoor space with good lighting, and it's been difficult to find the perfect place on campus that would be empty and accessible to us.

4. Goals for next week

- Wrap up final usability tests and perform analysis of results.
- Draft report of findings of usability tests.
- Film video of prototype on ambitious test track for final presentation.
- Complete second draft of presentation poster, integrating CS and ENP work.
